COURSE COMPETITION / STUDENT INSTRUCTIONS

From Moodle link to first Kaggle submission

Use your own Kaggle account, join the course competition, then form one competition team with your assigned group name. Keep the final CSV tied to the model in your delivered notebook.

1 Access the competition

1

Open Kaggle through Moodle

Open the **competition link on Moodle**. Sign in to Kaggle or create a personal account. Each student should use their own account.

2

Join the competition

On the competition page, choose **Join Competition** and accept its rules if prompted. Every group member must join before being added to the team. Check the competition's Overview and Rules pages for the current dates and limits.

2 Register your course group as a Kaggle team

3

Set the exact team name

Open **My Team** or the competition's team area. The group representative creates or renames the competition team. Use **ML_Group_XX** for Machine Learning or **ATI_Group_XX** for Advanced Topics in AI. Replace XX with your assigned two-digit number, for example **ML_Group_03**.

4

Add the other members

Invite teammates or use the team merge flow shown by Kaggle. Members accept the invitation or merge request from their own accounts. The representative checks that the final team name and member list are correct before anyone uploads a file.

Use the competition team, not a shared login

Kaggle submissions and daily limits belong to the competition team. Do not create one account for the whole group. If a teammate cannot be added, confirm that they opened the Moodle link and joined the competition first.

3 Prepare and upload predictions

5 Download the competition data

Use the competition's **Data** tab to get **train.csv**, **test.csv**, **clientes.csv**, and **sample_submission.csv**. Train and validate with the permitted data. The test labels are hidden.

6 Create the CSV

Predict **repeat_purchase_90d** for every row of **test.csv**. Copy the two-column structure from **sample_submission.csv**. Keep all **986** test IDs exactly once, use **0** or **1** for each prediction, and omit the pandas index and any extra columns.

Required file format

```
ID,repeat_purchase_90d
10000006,1
10000008,0
```

These rows show the format only; the values are not answer labels.

7 Submit and check the result

Give every upload a new versioned filename, such as **ML_Group_03_Version01.csv** or **ATI_Group_03_Version02.csv**. Choose **Submit Predictions**, upload the CSV, and wait for processing. Open **My Submissions** to confirm that it scored. The competition allows up to **50 submissions per day per team**.

4 Choose one final entry

8 Select the notebook's result

Before the deadline, use **My Submissions** to select **exactly one** scored upload as the final submission. Follow the selection instructions on Moodle and verify the selected file. Its predictions must match the final solution in your delivered notebook.

Before you finish

Check the exact team name and members; a scored CSV with 986 unique IDs; one selected final submission; and a notebook that reproduces that file. The visible leaderboard uses **70%** of test rows, and the remaining **30%** are revealed after the competition closes.

For Machine Learning, the project brief gives a delivery deadline of **22 December 2026 at 17:59**. ATI students should use their own course instructions for deadlines and assessed deliverables. Check Kaggle's competition timeline for its submission close time.
